

BRILLIANT BUGS

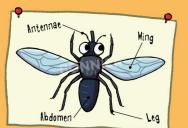

Bugs have been crawling creeping wriggling and buzzing on Earth for over 400 million years! They come in an amazing variety of colours shapes and sizes, and no matter where you are, you won't have to look too far before you find one.

Scientist

What is an insect?

Insects are the most common type of bug. They have three body parts, three pairs of legs and two antennae (or feelers). Most have wings Ants, flies, moths and wasps are all linsects.

Counting Creepy-Crawlies

There are so many bugs in the world it is impossible to count them all. Some scientists believe there could be 200 million insects for every single person on the planet!

Big families

There are more insects and bugs on Earth than any other kind of animal. Female bugs can lay hundreds or even thousands of eggs at a time.

House fly

bragontly

Ancient insects

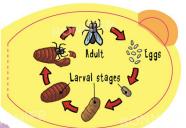

Fossils show that millions of years ago huge dragonflies buzzed overhead and massive cockroaches crawled on the land.

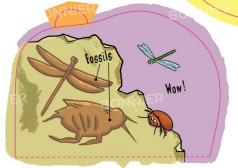

Cockroach

New discoveries

Scientists know about 900,000 different kinds of insect, but every year they discover thousands more. They think there may be at least 4 million left to find!

The eggs hatch out and the young, called larvae, feed and grow before turning into adults. It takes just two weeks for a housefly to go from an egg to a fully-grown fly.

Today's insects are much smaller, but many look very similar to their dragonfly was the same size as a modern day seaguill

Insect names often describe what the insect does, or where it is from. This tiny beetle is named after the character Paddington Bear, because it comes from Perul

BIGGEST BUGS

Big bugs are pretty frightening with their fearsome fangs, wide wings, long legs and super stings. Luckily, most of them are not harmful to humans

Giant weta

island off New Zealand. When fully grown it can weigh as much as a mouse!

African giant snail

The world's biggest kind of snail hides in its shell during the day and comes out at night to feast on leafy food.

Although it is big enough to eat a bird, this huge, hairy hunter from South America prefers insects.

Atlas moth

With wings that measure 27 centimetres across, this is the biggest moth in the world.

Hercules beetle

The mighty male Hercules beetle has horns that look like a pair of pincers.

The hairs on this scary scorpion's

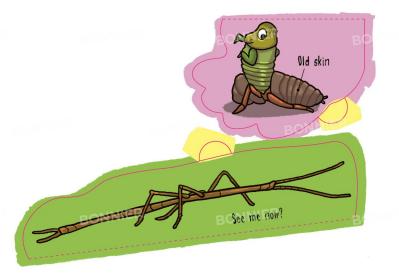

pincers help it find prey by sensing tiny

Its size means this big bug feeds on anything it can overpower, including lizards, frogs, mice and bats.

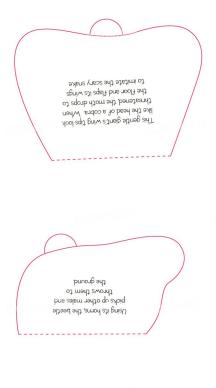

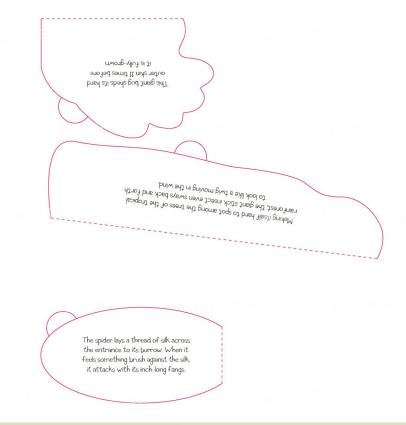

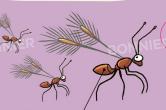

SMALLEST BUGS

Being small has its advantages. These tiny critters can fly or feed without being seen, and can fit in the smallest hiding holes.

Fairyfly

Just like a fairy, the fairyfly is hard to spot, but this small, hairy-winged wasp can survive almost anywhere, from rainforests to deserts.

Flea

Fleas like to drink the blood of cats dogs and humans. They use their long back legs to leap onto their victim.

Featherwing beetle

Half a millimetre long, this tiny beetle can be found in old logs and rotting leaves, feeding on mould and fungi

Ladybird

Pharaoh ant

These tiny pests like to make their nests in the nooks and crannies of buildings, such as hospitals, offices, factories and homes.

Fruit fly

Often found buzzing near fruit bowls and bins, this little, red-eyed fly loves to feed on ripe and rotting fruit and vegetables.

Western pygmy blue butterfly

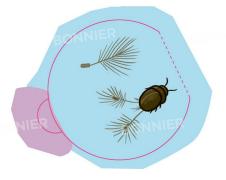

It's easy to miss the world's smallest butterfly. Its spread wings measure just 12 millimetres from tip to tip.

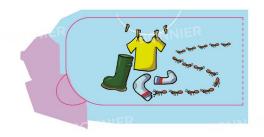

Blacklegged tick

Tiny blood-suckers that wait on the tips of leaves, ticks crawl onto the skin or fur of dogs, deer or humans to feed.

BONNIER

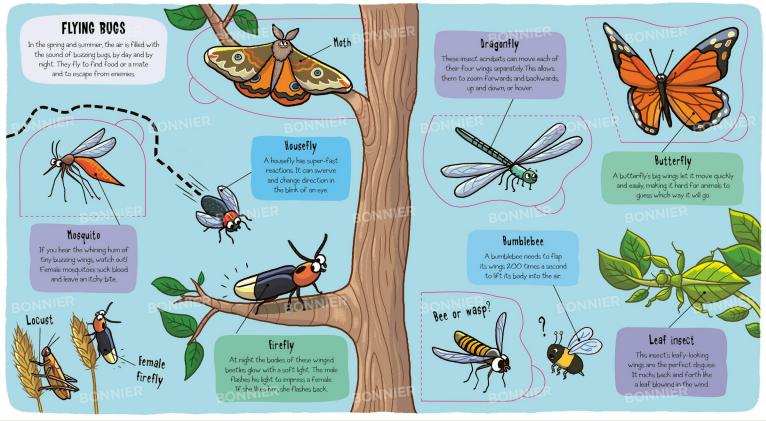

As well as feasting on our food, they can munch their way through fabric and rubber!

A hungry tick is about
3 millimetres long, but after
it has fed its body swells
to twice the size.

This beetle's feathery in the wind a bit like dandelon seed

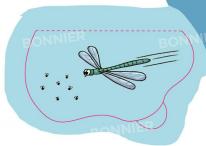

These bright little beetles are found all over the world. They come in many patterns and colours, including red, yellow, orange, black and blue.

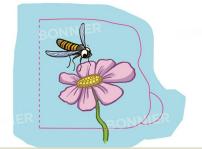

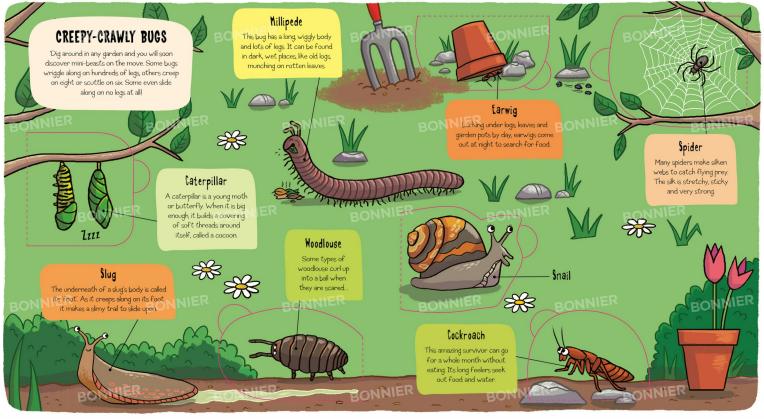

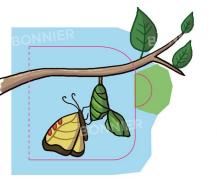

Dragonflies are fierce hunters. They live near water, snapping up other flying insects.

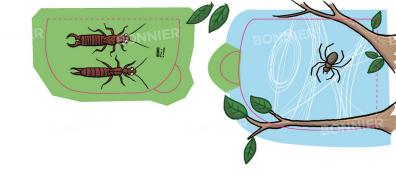

> Neither. It's a harmless hoverfly. It pretends to be a stinging insect to put off hungry predators.

A moth's delicate wings are covered in tiny scales. If a moth flies into a spider's web, its scales stick to the silk. The moth can fly off, leaving just a few scales behind.

> Mosquitoes are the favourite food of binds, bats, dragonflies and frogs.

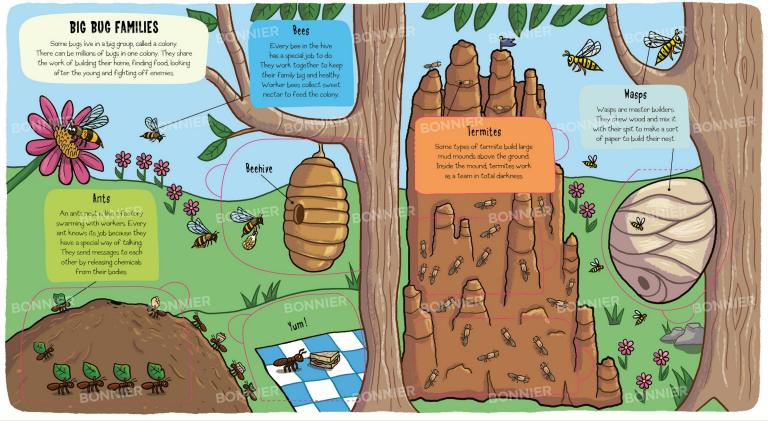

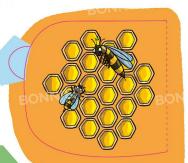

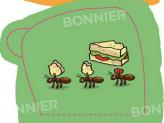

Different spiders make different-shaped webs. There are spirals, tubes, tunnels and tangles. The pincers at the end of its body fend off attackers. A female's pincers are straight, and a male's are curved.

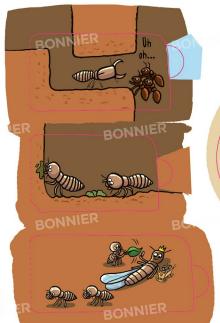

> A snail has a hard shell to protect its slimy body. When it is frightened it hides inside its shell.

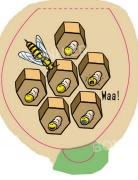

Cockroaches are nature's dustbins. They gobble dead or rotting animals and plants. ... just like this! Its hard, outer shell protects its soft belly and legs. Inside the cocoon the caterpillar grows six legs and beautiful wings, then it climbs out and flies away!

Soldier termites defend the mound from attack with their big pincers. BULMOJB SI Young wasp, or larva, has rows of hexagon-shaped holes Inside each hole a Worker termites repair the walls with spit and mud. Others grow fungus that they eat. apartment block each floor Inside, the nest is like a wasp Deep inside, the big queen lays eggs every day. They will grow up to be more workers and soldiers.

Worker bees also look after the queen bee and the eggs she lays, keep the hive clean, and defend it from attack

Foreger ants go out to gather food. They send out a chemical message to other ants. Follow me to the food!"

Soldier ants send out a warning message to the other ants when danger is near hottack!"

BEAUTIFUL BUGS

In a bug's world, beauty is not just for show. The colours and patterns have a job to do. They might send out a warning or help attract a mate. They can provide carnouflage or a sneaky disquise.

Glasswinged butterfly

See-through wings make it hard for attackers to spot this butterfly as it sips nectar from flowers.

This tiny Australian spider waves its brightly-coloured bottom in the air, hoping to attract a female.

Cha, cha, cha!

Picasso bug

The dazzling patterns on this African bug's back look like they have been painted on. They warn animals to stay away!

The colours change on this beetle's shell as it catches the light in the African sunshine.

Painted snail

These snails are found on the island of Cuba. Their shiny, stripy shells come in many shades of yellow, orange and red.

Sunset moth

The bright colours of this colourful moth warn predators that it is poisonous.

Beware of this flower!

Puss moth caterpillar

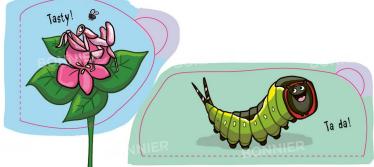

It's hard to see this caterpillar against the green leaves that it feeds on, but it hides a secret weapon.

It raises a pair of legs and claps them together as it dances to get the female's attention. The orchid mantis climbs onto a flower and sits very still ontil a flying insect is fooled into coming too close - then it becomes lunch! bra startling red-rimmed head and waves the long whips on the end of its body. to put off attackers! The Picasso bug can produce a horrible smell When scared, it raises

USEFUL BUGS

Some bugs are helpful to humans. They keep nasty bugs at bay, help plants to grow and even provide us with food.

Silkworm

A silkworm is a caterpillar. Before it turns into a moth, it spins a cocoon of pure silk threads around itself.

Lacewing

Lacewings and their young feast on pests, like leaf-gobbling caterpillars and sap-sucking greenflies.

Earthworms gobble rotting roots and leaves. This comes out the other end of their bodies as rich soil, perfect for plants to grow in

Feast your eyes on creepy-crawly food. Bugs and insects are eaten in many parts of the world because they are cheap, healthy and delicious!

Scorpion

Deep-fried scorpions on skewers are often sold at markets in China and Thailand. The sting in the tail is harmless when cooked.

A meal of dry-roasted mealworms tastes a bit like shrimp. Mealworms are the larvae, or young, of the mealworm beetle.

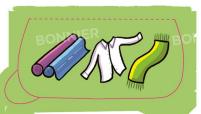

Cricket

Eaten fried, boiled and roasted, these crunchy critters are considered a tasty treat in Mexico, Thailand and Cambodia.

Leafcutter ants

In Mexico, these ants are toasted and served up at cinemas instead of popcorn.

People use the silk threads and weave them into a beautiful, soft cloth.

> Honeybees make honey to feed on over the winter. The busy bees make more than they need so there is plenty for beekeepers to collect.

Some people keep worms in special bins, and feed them scraps from the kitchen. The worms turn the waste into compost for the garden
