MYSTERIES OF THE DEEP

The ocean covers 70% of Earth's surface and is home to the majority of all life. Yet most of it remains unexplored. In fact, the deep sea is the least studied place in the planet! Deep dives using remotely operated vehicles (ROVs) often lead to the discovery of weird and wonderful animals, many new to science. Life at great depths is full of challenges, so the species found there can look dramatically different to those at the surface.

SCUBA DIVERS

Check out this dude checking out this devious little creature, getting up to mischief! Scuba divers are nixed cool, you get to see weird ocean critters up close and personal! Check out this dude checking out this devious little creature, getting up to mischief! Scuba divers are nixed cool, you get to see weird ocean critters up close and personal!

OCEAN DEPTH

An insect's head is like a strongman, made as long as the size of a full stop. At the front are the mouthparts, eyes and a pair of feelers, or antennae, which the insect uses to touch, smell and taste things.

SUNLIGHT

depth range: 0m to 200m

TWILIGHT

depth range: 200m to 1000m

MIDNIGHT

depth range: 1000m to 4000m

ABYSSAL

depth range: 4000m to 6000m

HADAL

depth range: 6000m onwards

A LIGHT IN THE DARK

LITTLE ANGLER

An insect's head is like a strongbox. Inside is a tiny brain the size of a full stop. At the front are the mouthparts, eyes and a pair of feelers, or antennae, which the insect uses to touch, smell and taste things. Some insects have up to three extra eyes on the top of their head, though they are far smaller.

COMMON BACCHUS
Bacchus bacchus

FRIENDLY BACTERIA

The insect's head is like a strongbox. Inside is a tiny brain the size of a full stop. At the front are the mouthparts, eyes and a pair of feelers, or antennae, which the insect uses to touch, smell and taste things. Some insects have up to three extra eyes on the top of their head, though they are far smaller.

ATLANTIC FOOTBALLFISH
Parasquilla grandis

ANGLER INFO

An insect's head is like a strongbox. Inside is a tiny brain the size of a full stop. At the front are the mouthparts, eyes and a pair of feelers, or antennae, which the insect uses to touch, smell and taste things.

ORCHID BEE
Euglossa imperialis

CHEMICAL REACTION

An insect's head is like a strongbox. Inside is a tiny brain the size of a full stop. At the front are the mouthparts, eyes and a pair of feelers, or antennae, which the insect uses to touch, smell and taste things. MYSTERIES OF THE DEEP

Oceans are the largest habitat on Earth. Around 94% of the species alive today are found there. But these are just the species we know about so far. Lots more marine animals are still waiting to be discovered, especially in the deep sea: the part of the planet we know least about. To explore this mysterious world, we use remotely operated vehicles (ROVs). They are controlled by scientists on board research ships and give us amazing glimpses of life far below the surface.

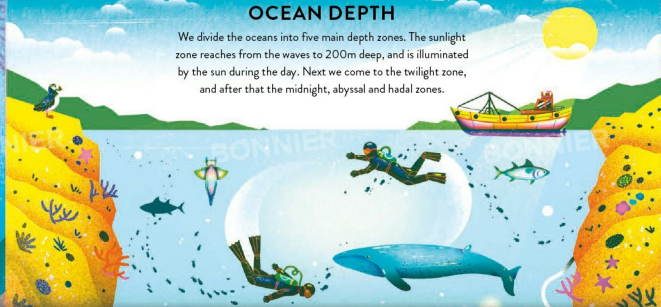

BLUE PLANET

Seen from space, Earth sparkles like a blue jewel. Why does it appear blue? Because water covers almost three-quarters of its surface! The oceans and seas in each region have different names, but are all connected, so form a single global ocean.

OCEAN DEPTH

We divide the oceans into five main depth zones. The sunlight zone reaches from the waves to 200m deep, and is illuminated by the sun during the day. Next we come to the twilight zone, and after that the midnight, abyssal and hadal zones.

INTO THE GLOOM

By the time we reach the twilight zone, the sun's rays are getting very faint. As we go deeper, the light continues to fade fast. By around 1,000m, there is no longer any sunlight at all. Beyond this point, the ocean is permanently dark.

MYSTERIES OF THE DEEP

The ocean covers 70% of Earth's surface and is home to the majority of all life. Yet most of it remains unexplored. In fact, the deep sea is the least studied place on the planet! Deep dives using a remotely operated vehicle (ROV) often lead to the discovery of weird and wonderful animals, many new to science. Life at great depths is full of challenges, so the species found there can look dramatically different to those at the surface.

WEIRD & WONDERFUL

The powerful lights of an ROV can show us all sorts of incredible creatures. These deep-sea animals are often very different from those that live nearer the surface.

Many, such as the glass octopus, produce their own light and actually glow. Some, such as the fangtooth, have huge jaws. Others have strange body parts, like the goblin shark's enormous pointed nose.

UNDER PRESSURE

In the deep sea, the pressure increases massively. This is due to the immense weight of water pressing down above. For example, at 4,000 deep, the pressure is 400 times greater than at the surface.
