Rainforest

Lorna Freytag

Rainforests are hot, wet places...

... full of plants and trees.

Many of the world's plants
and animals live here.

A vibrant illustration of a rainforest scene during a rainstorm. The background is a deep blue, filled with numerous light blue raindrops of varying sizes falling from a white, fluffy cloud in the upper left. On the left, a large green leaf with a herringbone pattern is partially visible. In the lower left, a bright yellow flower with several petals is shown. A small blue frog is perched on a green leaf just above the yellow flower. A pink bird is perched on one of the yellow flower's petals. On the right side, a large, dark green monstera leaf dominates the upper right corner. Below it, a green, polka-dotted bush or rock formation is visible. A green lizard is perched on the left side of this formation, and a small yellow frog is on the right. Two orange flowers are also on the formation. The overall scene is lively and colorful, emphasizing the rainforest environment.

In a rainforest it rains...
and it rains.

This helps plants
to grow quickly and stops
the planet from getting too hot.

Rainforests give us clean air to breathe...

... and they take away the dirty air.

Lots of useful food and medicine
comes from the rainforest.

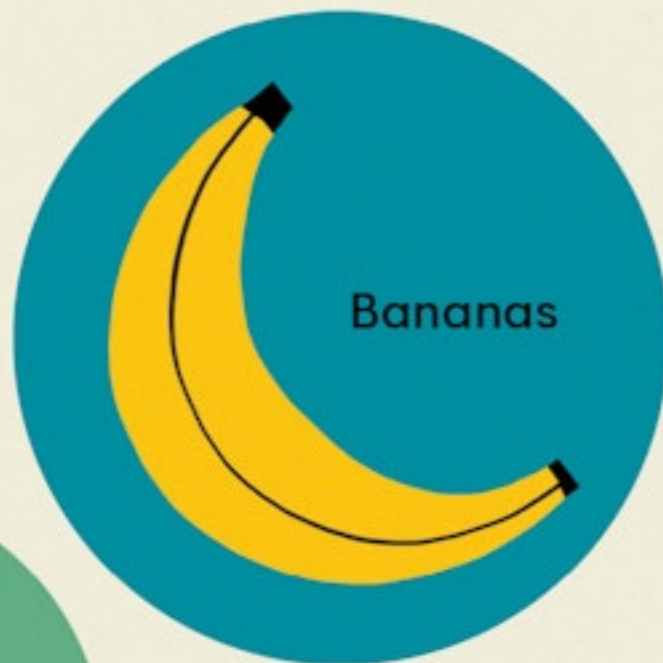

But we need to be careful not
to take away too much.

Trees are being chopped
down to make paper and
to clear space for farms.

But there are things we can do to help. Choose fair trade food that will grow back quickly...

... and plant more trees!

Use less paper and
cardboard and
recycle as much as
you can!

A little help
can make a
BIG
difference!
