Wheel

"The revolutionary design that makes the world go round"

17

Can you imagine a world without wheels? Apart from sledges and ships, there would be no vehicles – no carts, cobs, bikes, buses, trucks, trains, trams or aeroplanes. The first wheeled vehicles were animal-drawn carts with solid wooden wheels. They were invented in Mesopotamia (modern-day Iraq) around 3200 BCE, 300 years after the horizontal potter's wheel. These carts carried cargo to market and heavy loads, such as stone and timber for building projects. The horse-drawn chariot came next. In about 2500 BCE, chariot wheels were replaced rather than solid like a cartwheel, so they were faster and lighter. The wheel may be one of the simplest inventions, but without it our world would be completely different.

The ancient Romans raced chariots as a sport.

Roman chariots had wooden wheels.

Potter's Wheel

The very first wheels were used to make pottery. The art of pottery began around 30,000 years ago. Originally, potters would shape clay into pots with their hands, but this took a long time. The Mesopotamians invented a better method in around 3500 BCE. The potter's wheel was a large stone disc balanced on a stick called an 'axle', which could be spun. By putting clay on the wheel and spinning it, the potter could shape the clay quickly and easily. We don't know for sure, but it seems likely that the potter's wheel led to the invention of the vehicle wheel.

Internet

"The world at your fingertips"

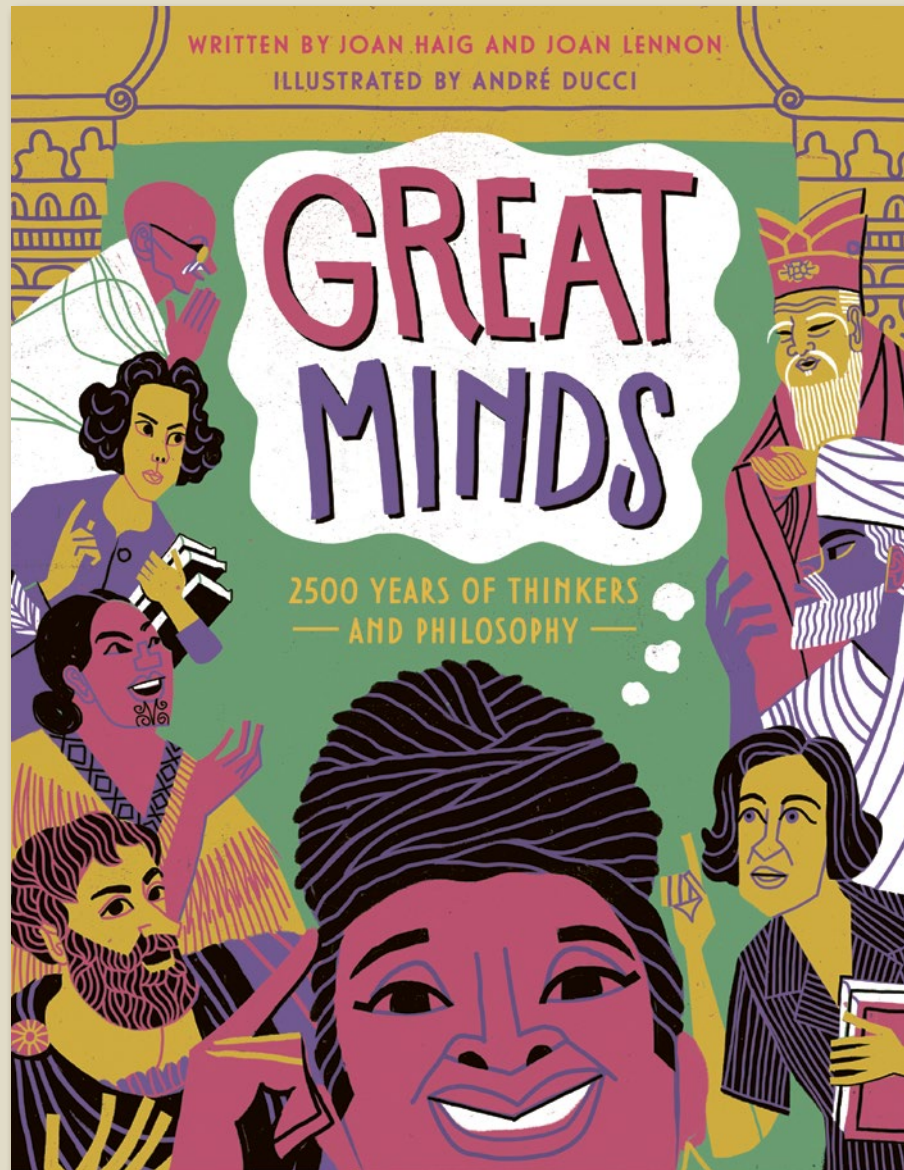

18

The invention of the Internet – a network of computers that 'speak' to each other – was a concentrated effort in the United States. The first computers were connected to each other in 1969, but scientists first began developing the Internet in the early 1960s during the Cold War (1947–1991), a time of heightened hostility between the USSR and the United States and when computers were the size of an entire room. The United States government wanted a communication system that couldn't be destroyed in a single attack, so they created ARPANET (Advanced Research Projects Agency Network): a series of linked computers across different locations, which allowed information to be relayed along telephone lines. The first message was sent in 1969. It was a simple word: LOGIN, but only the 'L' and the 'O' got through before the network crashed. By the end of the same year four computers were connected on the ARPANET. It took years to create the 'network protocol' that allows computers to transfer data and 'speak' to each other. From the 1970s this network grew into the global Internet, which now links billions of devices. Today, whatever you want – books, food, holidays, cars – with the Internet you simply click a button and wait for it to arrive. Social media sites allow people all over the world to communicate instantly. We can consume films, television shows, music and video games, and even do our banking online.

World Wide Web

The World Wide Web (WWW) is a gateway to the Internet. It's made up of search engines like Google and Safari, the Internet addresses (also called URLs) we type in, and the websites that appear on our screens. It was invented by a British computer scientist called Tim Berners-Lee in 1989 while working at CERN, a science research laboratory in Switzerland. The WWW made the Internet accessible to everyone, not just scientists and academics.

SAFETY FIRST

A tragic piece of history was made in 1909 when an Irish woman called Mary Ward became the first person killed by an automobile. While riding in an experimental open-top, steam-driven car, she fell out and was killed. Since then, designers have tried to make cars safer and easier to drive. Here are just some of the safety features found on modern automobiles.

Many modern cars come with sensors (accelerometers) fitted as standard. Modern phones that drive with their own GPS location capability, speedometers and up-to-date traffic information.

When adaptive headlights turned their swiveling focus in the opposite direction they automatically dip their beams to avoid blinding the driver. They also seem to follow upcoming bends in the road.

from locking up and stalling if the driver puts on the brakes too forcefully. Traction control ensures power is distributed evenly between the axles, which helps the car maintain its grip even on wet or icy roads.

ISLE OF MAN
TOURIST TROPHY

Every summer, the Isle of Man hosts one of the most amazing, and exceptionally dangerous motorcycle events in the world: the *Tsuroil Troop*, better known simply as the TT. Unlike other motorcycle races, the TT runs entirely on closed-off public roads, and riders from all over the world take their lives in their hands to speed, swerve and weave their superbike vehicles across the famous 60.72km-long Mountain Course.

years. These days, it's first week a glass case to protect its sections and fine tools, and the second to the next room. The 30-second operation has the results as spectacular as any past, reaching well over 200km/h, it

rides using all four skis is just the greatest by far. And there is a world of difference between touring people that are around a dedicated touring race to the nature **enthusiasts**, who often have the skills of pros. Nature-motivated recreational touring tends to be mixed with hiking, alps, dunes and cross. This attracts older hikers and amazing communities. One mistake, one misjudgment, and you're likely to turn out to be serious injury – or worse. Since 1987, there have been around 200 deaths related. For comparison, this danger is a bit part of the T1 experience, allowing them to become part of an elite group that's able to take on the toughest conditions: world-class climbing, mountaineering, ice-avalanche and even the danger of avalanches.

TRUCKS

With their growling diesel engines and 12 heavy-duty wheels, trucks are the workhorses of the road. There's nothing they can't haul: from food to furniture, petrol to paper, tree trunks to televisions. Without trucks on the people who drive them, our factories wouldn't function, our shops would be empty and our deliveries wouldn't be made.

People quickly realized how useful a thought was provided by an internal combustion engine would be, and in 1895 a German mechanical engineer called Karl Benz invented the first truck in the world. The inventor of the first car – see page 30, Riding on Two Wheels – and, powered by a rear-mounted petrol engine, it looked like a cart without the horses. More designs followed, but it took several decades of development before trucks began to take over from the centuries-old horse and cart. These days, trucks transport millions of tons of freight every year.

The proper name for a truck that pulls a separate trailer is actually 'trailer'. The trailer is attached to the tractor using a device called the fifth wheel, which is located behind the cab of a

Long-haul truckers have a tough life, traveling along highways and interstates on journeys that can take days. Their trucks have a sleeper compartment behind the cab complete with bed, storage space, fridge, heater and working facilities.

The average American long-haul truck driver will spend up to 300 days per year on the road, traveling over 100,000 miles per year, or around 800 miles per day. That's a long time to sit, and many drivers combine their moving homes to make their more comfortable.

ies to the PowerMax 2000. It's a Class 8 truck - the biggest available on the highways of the USA, the big one which houses the engine, means it's (technical) truck. But most the others are drive-also (the engine is called a prime mover). PowerMax 2000 has a conventional, allowing users to have their chassis, wheel plant, engine, wheel hub and drive shaft, or choose from a wide variety of customer specification options.

Trucks load extremely heavy loads - sometimes 40,000 lbs or more - so they need powerful engines. Many of these trucks are 18-wheelers, meaning they have 18 wheels. They also have 18 axles, meaning they have 18 points of contact with the ground. This is why they need so much power.

STEAM AND ELECTRIC AUTOMOBILES

Since their invention in the early 1800s, steam locomotives revolutionised the way people and freight were transported. However, some travellers wanted a more convenient vehicle that they didn't have to share and could use whenever they wanted. Some engineers created small, steam-powered road vehicles, while others decided to try electric battery automobiles. Many designs were created, but by the early 20th century it was clear that the internal combustion engine was going to be king of the road.

The first steam-powered road vehicle was designed by English inventor Richard Trevithick. Using a high-pressure boiler for more power, his Puffing Devil set off with six passengers in 1801 at a speed described by one witness as 'faster than I could walk' (about 6km/h). Unfortunately, only a few days after this historic journey, the boiler caught fire and Puffing Devil was destroyed.

Electric cars were very popular in Europe and the USA from the late 1800s to the early 1900s. They were quieter and smoother, didn't produce smoke and were easier to use than steam-powered automobiles. One of the first successful models was the Flocken Elektrowagen. Designed in Germany in 1888, its 1hp electric motor drove the back wheels and could reach around 16km/h.

One of the last and most advanced steam automobiles was the Doble steam car. Designed in 1924, the Doble Model E only required 30 seconds to boil the water needed to drive the engine, was easy to control and could reach speeds as high as 120km/h.

EARLY ENGINES

The age of the automobile really began with the invention of the internal combustion engine. When fuels such as petrol, diesel or kerosene are burned (or 'combusted') inside the engine (using an oxidizer such as air), they produce kinetic energy, which makes the vehicle move. Internal combustion engines are more fuel-efficient than steam engines, and proved far easier and more convenient to start-up, operate and maintain.

German inventor Karl Benz developed the first automobile powered by an internal combustion engine in 1885. His revolutionary Motorwagen had a 3hp petrol engine, three-spoked wheels with solid rubber tyres and one forward gear. Its top speed was around 16km/h.

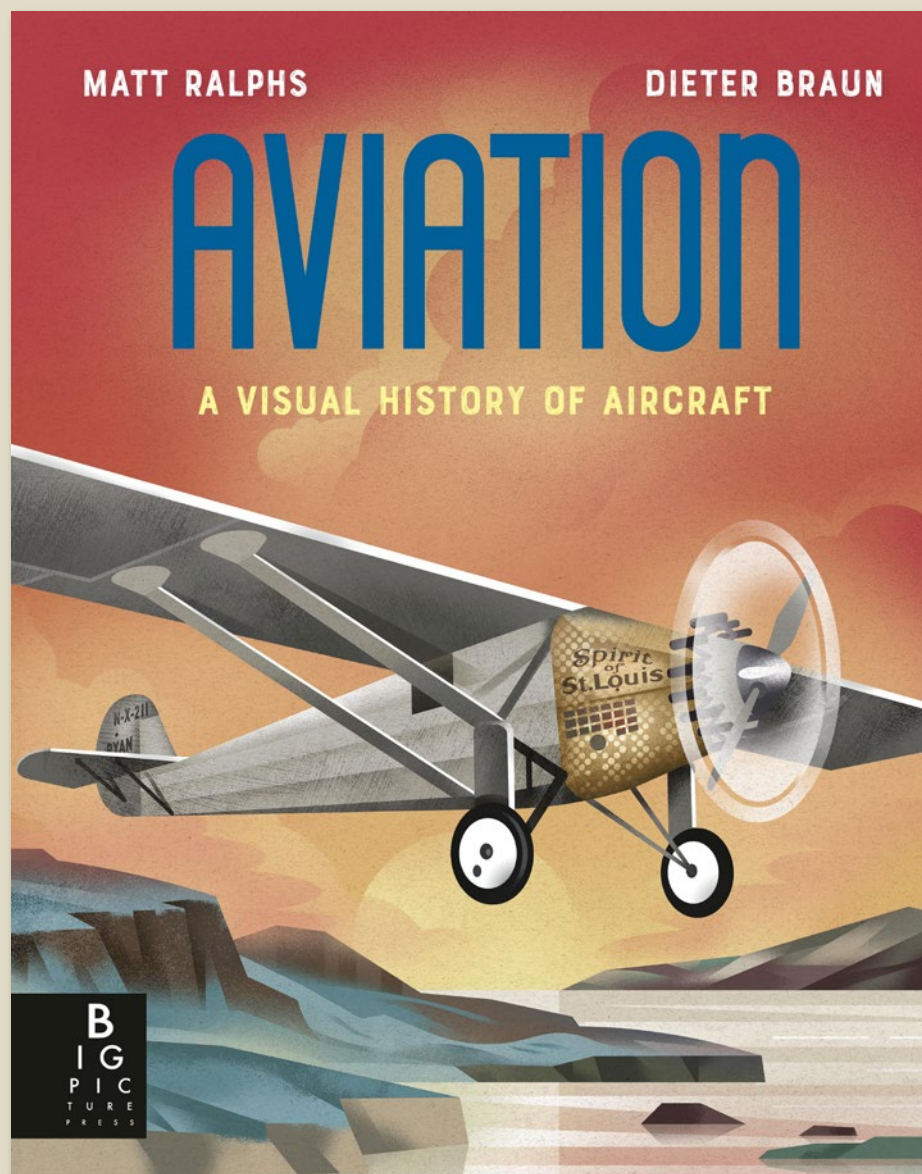

The first mass-produced car was the Oldsmobile Model R Curved Dash, 19,000 were built between 1901 and 1907. It was more affordable than most other cars at the time, had a 5hp engine, 2 forward and 1 reverse gear and came as either a 2-seater 'runabout' or a 4-seater family car.

Created in 1901 by German engineers Paul Daimler and Wilhelm Maybach as a racing car, the Mercedes 35 HP was a huge step forward in automobile design. It had a powerful petrol engine mounted at the front that drove the back wheels, a hand brake and a foot brake, 4 forward gears and 1 reverse gear.

INTRODUCTION

Humans have dreamed about Purg for thousands of years. It's not hard to imagine our primitive ancestors, who possessed the artistic skills to create beautiful cave paintings of the world around them – the landscapes, animals and each other – staring into the skies to watch both wind and clouds swirl and swirl and swirling like themselves. How does it feel to fly? And what does the world look like from up there? You're probably had a similar daydream yourself – imagining your house from above, then flying towards the sun, feeling the wind flow over your wings, and soaring towards the horizon and the unknown world beyond.

The first that anyone capable of lifting people in relation safety and carrying them for short distances were hot air balloons. The first was launched to great honour in France in 1783. Suddenly it was possible for people to take to the skies, and it heightened a frenzy of public interest; in the nation of *Rights*, many more demands followed. Tethered balloons were immediately put to use by artists to give an aerial viewpoint from above. But balloons are actively at the mercy of the wind, and pilots have to control over their direction of travel.

This changed one fateful day in 1903, when the first powered flight of a monoplane called the Flyer was made. It only lasted for 12 seconds, but it was enough to change our world. From that moment on, the development of the monoplane has never stopped. This constant advancement is aviation technology, funded with as much money, energy, materials and technical expertise, as is used on because monoplanes are so useful. They transport people and cargo faster than any other vehicle. They are a vital part of military campaigns. They help us see, explore and learn about our world. They introduce us with *aerobatics*, displays of speed and maneuverability that are a true art form. And they are the most important part of our world.

Don your aviation goggles and prepare for a breath-taking journey through the skies!

- AMAZING AIRCRAFT -
WRIGHT FLYER

On December 17th, 1903, Wilbur and Orville Wright changed the world forever. For years, these mechanically-minded American brothers had shared a vision of creating a machine that could fly further and more reliably than a glider, and, unlike a hot air balloon, wasn't forced to fly in a particular direction by the wind. In short: the first flying vehicle that the pilot had complete control over. After years of planning and countless experiments, their vision became a history-making reality in the sandy dunes of Outer Banks, North Carolina, USA.

WFF willer up along as the Flier travelled down a wooden launch rail, took off and flew close to the ground for 10 seconds. These two flights occurred that day, the last being the longest at 58 seconds and 200m. Unfortunately, the Flier was damaged on landing and never flew again.

WOOD, CANVAS AND STRING

The aeroplane was only a year or two old and had never been seen used in combat when the First World War broke out in 1914. But over the course of the next five years, both sides realized just how useful these flying machines could be. Aeroplane technology advanced rapidly as each side strove to gain air superiority.

The book targets a wide range of users. The Manual Flying and Performance section, page 275, includes a section on "How to Fly a Cessna 441" and a section on "How to Fly a Cessna 441" and a section on "How to Fly a Cessna 441".

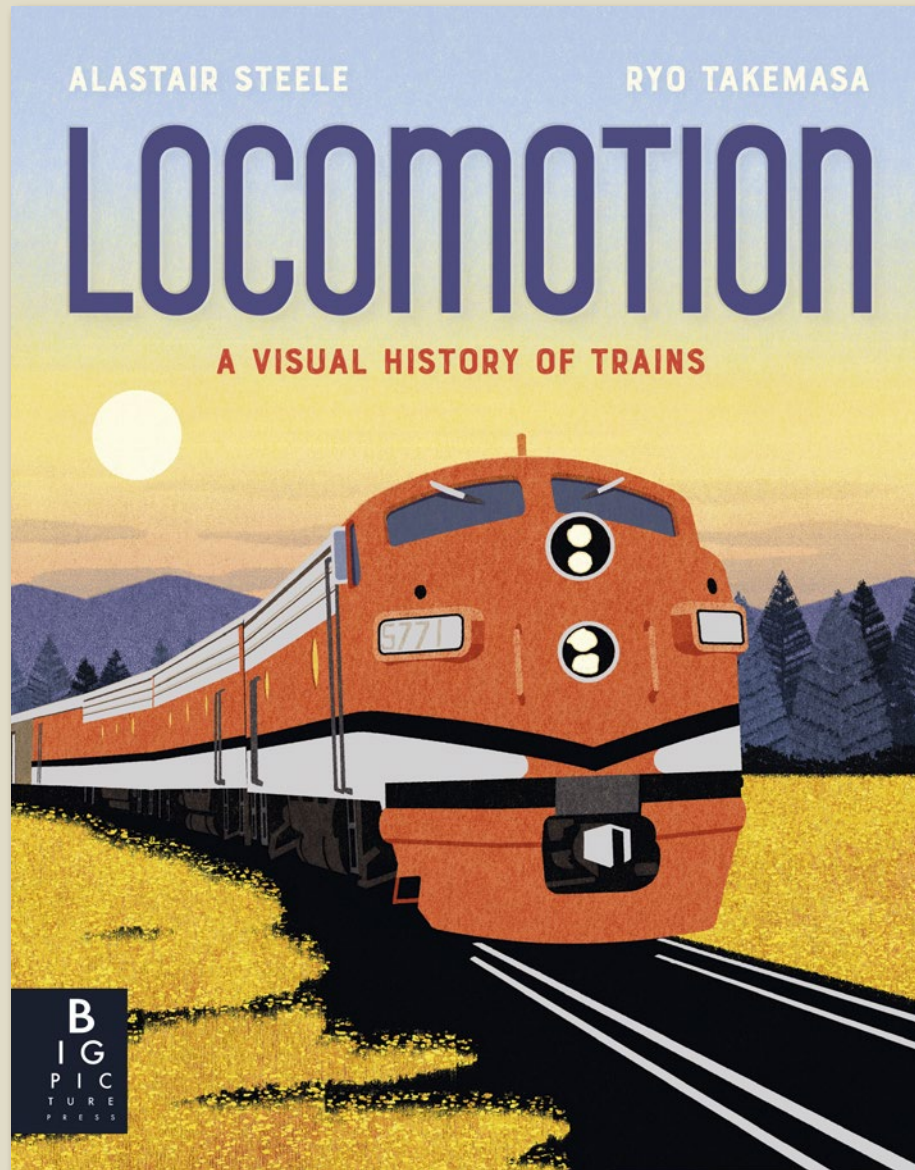

The pilots who dived over war-torn Europe needed calm nerves and skill. However, many had very little training, and the experience was short. Pilots who shot down more than five aircraft were called 'aces'. This Fokker D-12 fighter was flown by German ace Manfred von Richthofen - also known as the Red Baron.

Locomotion

THE FIRST RAILWAYS

Today, railways are commonplace in many parts of the world. They snake around our coastlines, zip across our countryside and transport goods and millions of passengers every single day. It is strange to think that they have only been around as we know them for about two hundred years.

The first steam engines were used in British mines during the 17th century to pump water. It wasn't until before engineers tried using steam power to propel vehicles, and in 1802 the inventor Richard Trevithick built the very first working steam locomotive.

ELECTRIC LOCOMOTIVES

The first electric train was tested as far back as 1837. Unlike steam trains, electric locomotives do not carry fuel on-board. Instead, they are powered by electricity which can be supplied from overhead lines, a third rail or in storage such as batteries. Because electric trains can be powered by renewable energy sources, they are considered less polluting than steam or diesel trains.

The first electric passenger train was presented by Werner von Siemens at an exhibition in Berlin in 1879. Consisting of a small locomotive and three cars, it reached a speed of just 13km/h.

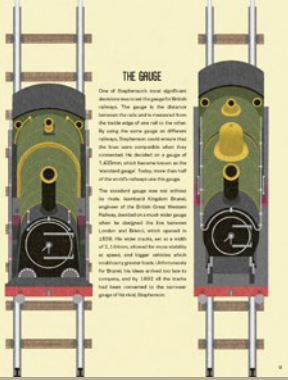

The *ETR 200* is a record-breaking electric passenger train. It is widely considered one of the first ever high-speed trains and was put into service in 1936. In 1939, it broke the speed record for trains by reaching just over 201km/h.

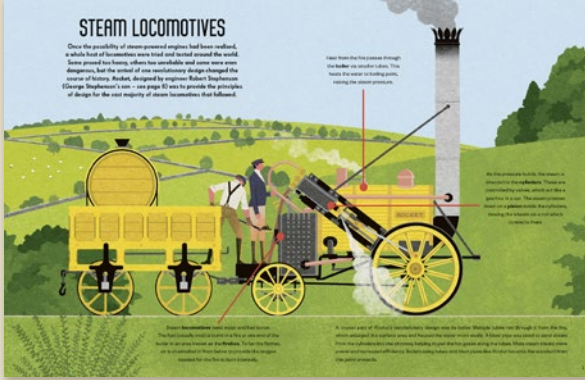

The ICE (InterCity Express) is one of Germany's most successful electric trains. The third generation ICE 3, can reach speeds of 300km/h. Since 2018, it has run on entirely **renewable energy** sources.

THE GAUGE

STEAM LOCOMOTIVES

Once the possibility of steam-powered engines had been realized, a whole host of locomotives were tried and tested around the world. Some proved too heavy, others too unreliable and some were even dangerous, but the arrival of one revolutionary design changed the course of history. Rocket, designed by engineer Robert Stephenson (George Stephenson's son - see page 30) was to provide the principles of design for the vast majority of steam locomotives that followed.

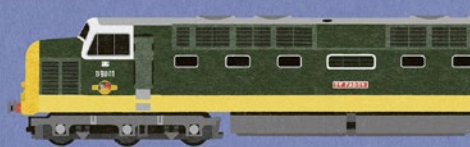

DIESEL LOCOMOTIVES

In a diesel locomotive, the power comes from an engine that burns diesel oil. While a steam locomotive needed two people to crew it and hours to attain the right steam pressure, a diesel locomotive could simply be switched on and driven away, making them much easier and much cheaper to run. Rudolf Diesel patented his first diesel engine in 1898, but it wasn't until around 1912 that they were first used in a locomotive.

The famous *DRG Class SVT 877 Hamburg Flyer*, often referred to as the 'Flying Hamburger', was first put into service in 1933. Its smooth, rounded shape was influenced by Zeppelin **airships** allowing for minimal air resistance.

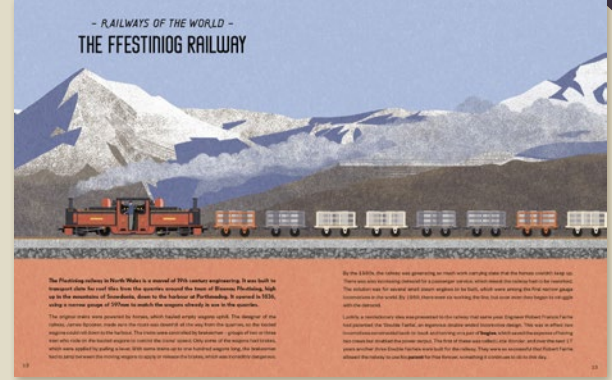

The *De10c*, built in 1956, was considered the most powerful diesel locomotive in the world at that time.

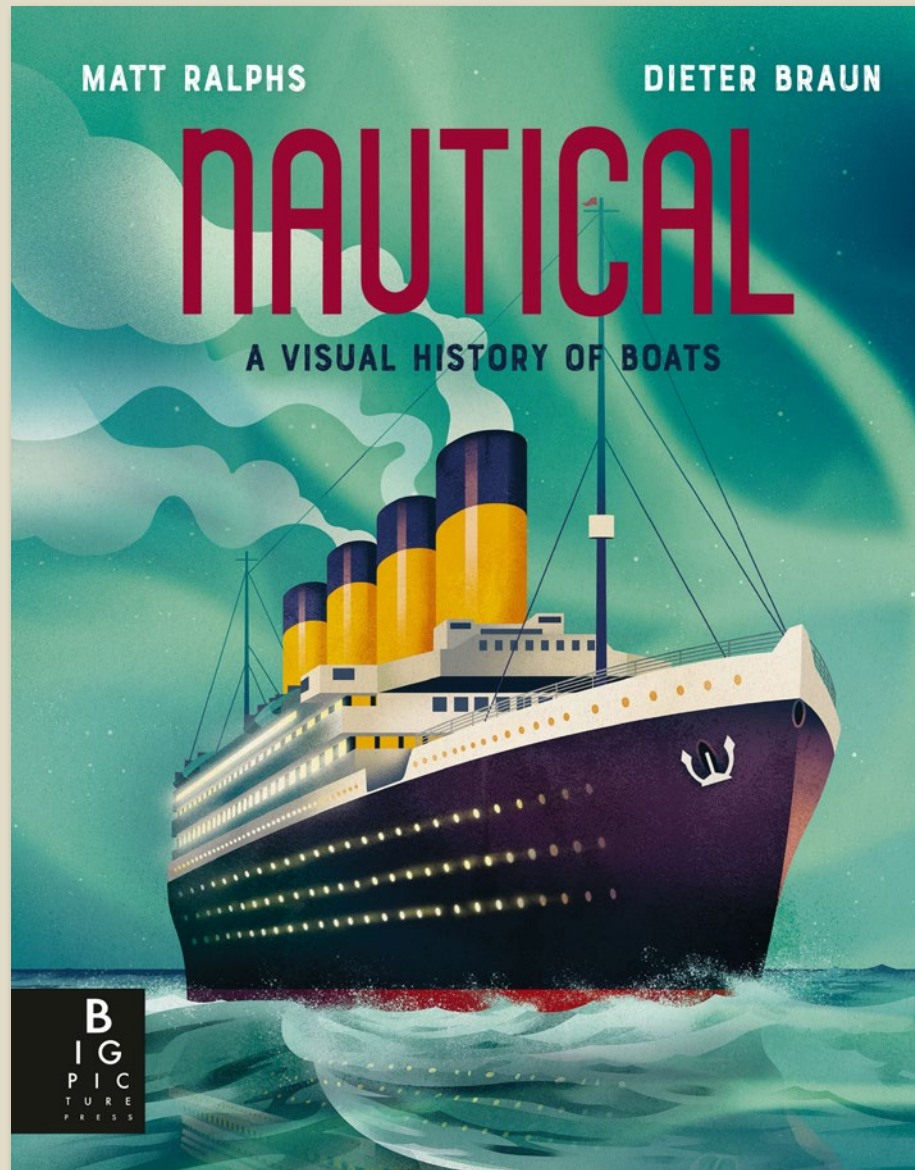

The *Intercity 125* is one of the most successful diesel trains of all time. So named because it was designed to cruise at 125 mph (about 201 km/h) when in service, it also holds the all-time speed record for diesel trains of 238 km/h, which it reached in 1987.

RICH AND POOR

THE HISTORY OF WEALTH

Wealth is the difference in wealth between the richest and the poorest. It has been around since the beginning of time. In the past, it was measured in land and gold. Today, it is measured in money. The rich have always been rich, and the poor have always been poor. But the gap between them has grown much wider in recent years.

WEALTH CONCENTRATION

One of the biggest reasons for the gap is the way that wealth tends to get concentrated in the hands of a few people. This is called wealth concentration. It has been happening since the beginning of time. The rich have always been able to pass on their wealth to their children, while the poor have had to start from scratch.

CAUSES OF INEQUALITY

There are many reasons for wealth inequality. Some people have more talent than others. Some people have more connections. Some people have more luck. All of these things can lead to wealth inequality. But the biggest reason is the way that the economy is set up. The rich have more power than the poor, and they can use that power to make themselves even richer.

WHAT'S WRONG WITH WEALTH INEQUALITY?

Wealth inequality is a problem because it means that some people have more power than others. This can lead to corruption and other problems. It can also mean that some people have more access to education and healthcare than others. This is not fair, and it needs to be fixed.

GOLDEN YEARS

AN INTERNATIONAL SYSTEM

In the 1920s, the gold standard was a system where the value of a country's currency was linked to the amount of gold it had. This was a way to keep the value of money stable. But it was also a way to keep the rich rich and the poor poor.

THE COST OF WAR

World War I was a huge cost to the world. It killed millions of people and destroyed a lot of property. It also led to a lot of economic problems. The gold standard was one of the things that made the war so costly.

FROM COUNTERFEIT COINS TO FALSE NOTES

FIRST COUNTERFEITS

Counterfeiting has been around since the beginning of time. It was a way to make fake money that could be used to buy things. But it was also a way to keep the rich rich and the poor poor.

FINANCIAL MARKETS

At regular markets people buy and sell things like food and clothing. At financial markets, people trade money-related assets. These include stocks and bonds. Stocks are shares in a company that the company sells to raise capital. Shareholders are paid dividends (regular sums paid out of the company's profits). Bonds are certificates issued by a government or corporation, promising to repay borrowed money at a fixed rate of interest. Financial markets can be physical places, like the New York Stock Exchange, or they can take place online.

THE FIRST BONDS

In the twelfth century, the government of Venice came up with a new way of raising money to fight a war. It offered its citizens certificates, known as prestiti, in exchange for a loan, promising to pay them back by a certain time, plus 5 per cent interest. These were the first government bonds. Before long they became a popular investment, and a market developed for the buying and selling of prestiti.

THE FIRST STOCKS

Founded in 1602, the Dutch East India Company was the first company to sell shares to the public. The money it raised from this funded its voyages to the East Indies, and it paid its shareholders out of the profits from its trade in enslaved people and spices. The shares were traded in the Amsterdam Stock Exchange, also established that year.

THE DAILY NEWS

NEW YORK CITY

THE WALL STREET CRASH

FINANCIAL MARKETS CAN BE VOLATILE. A RUMOUR OR A MINOR PIECE OF ECONOMIC NEWS CAN CAUSE BIG SWINGS IN PRICES. THE DESIRE TO MAKE MONEY OR AVOID LOSING IT IS A POWERFUL ONE, AND A

HERD INSTINCT CAN SOMETIMES TAKE OVER WITH PEOPLE STAMPEDING TO BUY OR SELL. THE MOST SPECTACULAR EXAMPLE OF THIS WAS THE WALL STREET CRASH OF 1929.

THE ROARING TWENTIES

The 1920s was boom time in the United States. There was a spirit of optimism in the country and it became fashionable to play the stock market. Share prices soon rocketed to a point where they represented a value far greater than the total worth of their companies' assets. This was now a mania – a period when everyone, from wealthy financiers to common investors, lost touch with reality and seemed to believe that prices could keep rising forever.

DISASTER

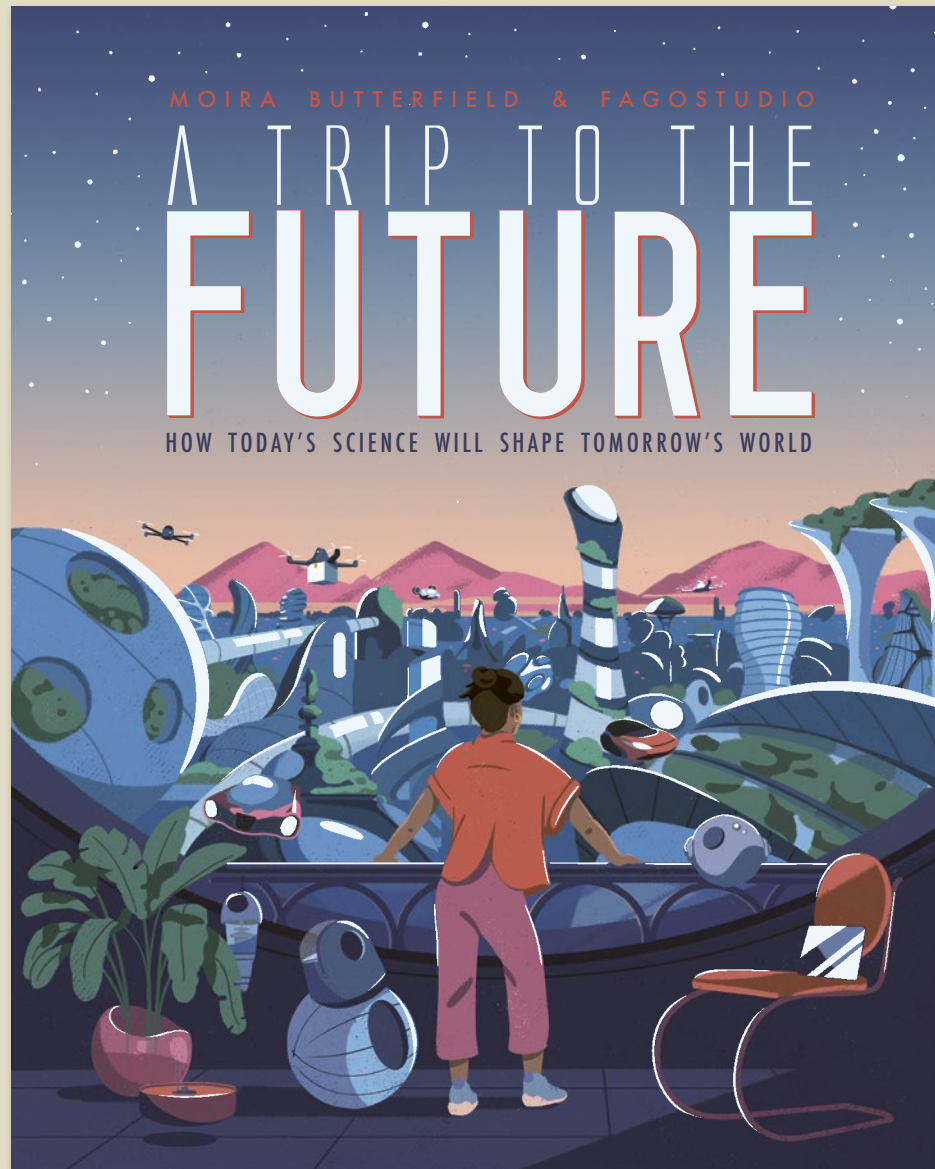

The crash occurred at the end of October 1929, during three calamitous days of trading at the New York Stock Exchange on Wall Street, when huge numbers of people decided collectively it was time to sell. With so many sellers, there were few buyers, and share prices plummeted. In those three days, billions of dollars were wiped off the value of American companies. And over the following years the market kept on falling. By 1932, stocks had lost nearly 90 per cent of their pre-crash value.

AFTER EFFECTS

As a result of the crash, businesses were bankrupted, banks closed, millions lost their jobs and the world plunged into a deep and lasting economic depression. This had a big political impact. In Europe, extreme right-wing parties exploited the misery of mass unemployment, blaming 'foreigners' such as Jews. Germany's Nazi Party rose to power in 1933. The consequences for the world would be devastating.
