- Stunning watercolour artwork by the phenomenally talented natural history artist William Spring.
- Large format with 100% foil cover treatments makes this the ideal gift book.
- A poignant message with significance for today's world.
- Includes 50 beautiful creatures to marvel at.
- The perfect book for fans of *Hidden Planet* by Ben Rothery and *The Golden Mole* by Katherine Rundell.

Aldabra Giant Tortoise

It was the tortoise from Aesop's famous fable The Hare and the Tortoise who gave us the phrase 'slow and steady wins the race' (it couldn't be true for this animal, especially when put into context). Tortoises have been gently plodding around the planet for 300 million years.

The genetic structure of the vine of the long-necked plantain, the *Urtica dioica* L., is a highly variable system, as has been shown by 100 microsatellite loci. This variability is due to the fact that the vine is a perennial plant, which can live for many years and produce many offspring. Pygmy Seahorse

As its name suggests, the pygmy woodhoose is very tiny indeed, typically measuring just a centimetre or two in length.

The Barghaire's pygmy marmoset has evolved to live in wonderfully well-recognized that it was first discovered until the late 1960s. It was only spotted when a scientist who was studying a piece of coral found the tiny animal clinging to it in a branch. Today, there are now known species of pygmy marmosets, most of which live in the Cordillera of Southeast Asia. In 2008, the *Myiomeris pygmaea* (aka known as the 'Japan pig') was discovered on the coast of Japan. More recently, in 2020, *Myiomeris* rats, also known as the African pygmy marmoset, were discovered in South Africa.

Sperm Whale

The whale has been the stuff of myth and legend for as long as humans have ventured across the world's oceans. Looking at the sperm whale, it's easy to see why.

The sperm whale is truly awe-inspiring. It is one the largest animal predators in the world, measures around 35 meters in size in length, and weighs around 40 metric tons. Some have been recorded as being much larger, but these giant whales are very rare. The sperm whale has several unique adaptations that make it not just another whale species.

The information, which you may have inferred to be noise, allows the whale producers sounds, such as clicks and whistles, that travel through the water, as objects, and are reflected back to the whale. It then hears these reflected sounds and uses the information to locate the object the sound bounced off. Some animals can sense the air rather than water - bats, for example (see page 55). To produce its own sounds, the sperm whale has phonic lips in its nose. As air passes through the nasal passage and past the phonic lips, the surrounding tissue vibrates, producing the loudest sounds of any animal.

The sperm whale's incredible head, which takes up almost a third of its body, is almost purely devoted to noise. Within it, along with a huge brain containing an olive-sized cetacean gemstone, is a ball of other complex fluid-filled

There are fluid-filled structures beneath a whale's skin that produce sound, but not in such

For the whole when it came into contact with other animals. The strategy was first shown in the mid-life members of the whaling ship *Essex*, which captured Humpback Whales the second *Blade* died.

For a long period of time, spermatozoa, a highly flammable substance, were used to fuel lamps. The burning of this oil led to the heating of sperm whales in large numbers, causing many populations to become extinct. In the late 1970s, sperm whaling was stopped in the late 1970s. Unfortunately, some reactions continue to argue in this position. Whales are also threatened by climate change and pollution, as well as becoming entangled in commercial fishing nets.

Bat-Eared Fox

The name explains it all: a fox with ears like a bat. But why has this extraordinary animal developed such unusual features?

Living in small, tightly knit social groups, these foxes make their home on the savannahs of eastern and southern Africa. This is a dry and hot landscape where food is limited and danger is ever-present. The fox's large ears are an adaptation shared by many other inhabitants of these kinds of environments, such as the fennec fox, showing how evolution works to find the most efficient 'solution' to the problem of survival (bearing in mind that nothing is ever 'finished' in evolution – it's a constant work in progress).

In the case of a fox, its specialized ears serve several purposes. Firstly, they give it an astonishing sense of hearing. Not only does this allow the fox to detect predators and keep itself safe, but it also helps it to be a predator itself. It consumes a wide range of prey, including metals, spiders and millipedes, and occasionally even small reptiles and mammals – all of which are elusive, fast and, more often than not, actually hidden, as in the fox or shelter underground. In such situations, the ability to hear your dinner before you see it makes it a lot easier to locate. Bat-eared foxes can often be seen walking slowly with their noses to the ground (their sense of smell is also extremely sensitive), their huge ears cocked forward, listening for the tiny scratch of an insect in its burrow. Once the fox has located its prey, it swiftly digs it up and seizes its target. Specialized teeth make it easy to crunch through the (often thick) armor of its insect lunch.

The ears also serve another vital function, one that's particularly important if you live in a hot environment and you're covered in fur: heat regulation. Like those of the elephant (see page 48), the fox's ears serve as radiators. Because of the fine capillary veins close to the surface of its ears, the fox can remain at a comfortable temperature by venting excess heat from its blood into the air.

Apart from its large ears, the bat-eared fox also has more teeth than other species of fox (between 44 and 50 teeth in total). In fact, these unique creatures have more teeth than most mammals. Bat-eared fox has three upper and four lower molars on each side of the mouth, while other members of the canid (or dog) family have two upper and three lower molars. These extra teeth mean that the fox is perfectly adapted to chewing creepy crawlies.

Although occasionally hunted, the bat-eared fox is one of the increasingly rare examples of an animal with a safe conservation status. It is helpful in keeping down the number of termites, which are considered pests. This means that the biggest commercial value for humans comes from keeping these foxes alive. Most threats to this fox come from the dangers its food sources might face, such as flooding from damming or the use of insecticides.

RICH AND POOR

THE HISTORY OF WEALTH

Wealth is the difference in wealth between the richest and the poorest. It has been around since the first humans lived. In the early days, wealth was measured in terms of land and livestock. As time went on, it became more complex, including money, art, and technology. Today, wealth is often measured in terms of money and property.

WEALTH CONCENTRATION

One of the biggest reasons for inequality is the way that wealth tends to get concentrated in the hands of a few. This is often due to the fact that wealthy people have more resources and can invest their money more effectively than poorer people. This leads to a cycle where the rich get richer and the poor get poorer.

CAUSES OF INEQUALITY

There are many reasons for wealth inequality. Some people have more resources than others, while others have more skills or connections. Some people are born into wealth, while others have to work hard to earn it. Inequality can also be caused by government policies, such as tax laws and social welfare programs.

WHAT'S WRONG WITH WEALTH INEQUALITY?

When a small number of people own most of the wealth in a country, it can lead to a number of problems. For example, it can lead to a lack of social mobility, where poor people have a hard time improving their lives. It can also lead to a lack of political participation, where the wealthy have more influence over the government than the poor.

GOLDEN YEARS

When a country's economy is strong, it is often called a 'golden year'. This is usually due to a combination of factors, including a strong economy, low unemployment, and high consumer confidence. The 'golden years' of the 1920s in the United States are a famous example of this.

AN INTERNATIONAL SYSTEM

In the 1920s, the gold standard was a system where the value of a country's currency was linked to the amount of gold it held. This was a way of ensuring that currencies were stable and that international trade was easy.

THE COST OF WAR

World War I had a huge impact on the global economy. It led to a massive increase in government spending and a huge loss of life and property. This led to a period of economic hardship in the years following the war.

SECTION THREE

After World War I, the international system was in a state of flux. The United States emerged as a major power, while Europe was weakened. This led to a period of economic uncertainty and a search for a new international system.

THE NEW ORDER

In the 1930s, a new international system was developed. This was the Bretton Woods system, which was based on the gold standard but with some key differences. It was designed to ensure that the world economy was stable and that international trade was easy.

FROM COUNTERFEIT COINS TO FALSE NOTES

For as long as money has existed, people have tried to forge it. Counterfeit money is money that is made to look like real money but is not. It is often made by copying real money or by using fake materials. Counterfeit money is a problem for governments and businesses alike.

FIRST FORGERIES

The first known counterfeit coins were made in ancient times. They were often made by melting down real coins and then casting them into a new shape. This was a way of making more money than the government allowed.

ALVES dos REIS

Alves dos Reis was a famous Portuguese counterfeit master. He was known for his ability to create perfect copies of real money. He was eventually caught and executed for his crimes.

THE BANK OF PORTUGAL

The Bank of Portugal was a major bank in Portugal. It was founded in 1763 and was one of the first banks in the world to issue paper money. It was a major force in the Portuguese economy.

FINANCIAL MARKETS

At regular markets people buy and sell things like food and clothing. At financial markets, people trade money-related assets. These include stocks and bonds. Stocks are shares in a company that the company sells to raise capital. Shareholders are paid dividends (regular sums paid out of the company's profits). Bonds are certificates issued by a government or corporation, promising to repay borrowed money at a fixed rate of interest. Financial markets can be physical places, like the New York Stock Exchange, or they can take place online.

THE FIRST BONDS

In the twelfth century, the government of Venice came up with a new way of raising money to fight a war. It offered its citizens certificates, known as prestii, in exchange for a loan, promising to pay them back by a certain time, plus 5 per cent interest. These were the first government bonds. Before long they became a popular investment, and a market developed for the buying and selling of prestii.

THE FIRST STOCKS

Founded in 1602, the Dutch East India Company was the first company to sell shares in its business to the public. The money it raised from this funded its voyages to the East Indies, and it paid its shareholders out of the profits from its trade in enslaved people and spices. The shares were traded in the Amsterdam Stock Exchange, also established that year.

THE DAILY NEWS

OCTOBER 1929 NEW YORK CITY

THE WALL STREET CRASH

FINANCIAL MARKETS CAN BE VOLATILE. A RUMOUR OR A MINOR PIECE OF ECONOMIC NEWS CAN CAUSE BIG SWINGS IN PRICES. THE DESIRE TO MAKE MONEY OR AVOID LOSING IT IS A POWERFUL ONE, AND A HERD INSTINCT CAN SOMETIMES TAKE OVER WITH PEOPLE STAMPEDING TO BUY OR SELL. THE MOST SPECTACULAR EXAMPLE OF THIS WAS THE WALL STREET CRASH OF 1929.

THE ROARING TWENTIES

The 1920s was boom time in the United States. There was a spirit of optimism in the country and it became fashionable to play the stock market. Share prices soon rocketed to a point where they represented a value far greater than the total worth of their companies' assets. This was now a mania – a period when everyone, from wealthy financiers to common investors, lost touch with reality and seemed to believe that prices could keep rising forever.

AFTER EFFECTS

As a result of the crash, businesses were bankrupted, banks closed, millions lost their jobs and the world plunged into a deep and lasting economic depression. This had a big political impact. In Europe, extreme right-wing parties exploited the misery of mass unemployment, blaming 'foreigners' such as Jews. Germany's Nazi Party rose to power in 1933. The consequences for the world would be devastating.

DISASTER

The crash occurred at the end of October 1929, during three calamitous days of trading at the New York Stock Exchange on Wall Street, when huge numbers of people decided collectively it was time to sell. With so many sellers, there were few buyers, and share prices plummeted. In those three days, billions of dollars were wiped off the value of American companies. And over the following years the market kept on falling. By 1932, stocks had lost nearly 90 per cent of their pre-crash value.

INTRODUCTION

Imagine a world where all around us are people with bionic limbs, machines attached to their heads and cameras for eyes. This same world has cyborgs who can hear colours and communicate via their teeth, and even people who use robotic skeletons to walk elsewhere. In this world, children have to hear with external ears, and people have without legs can walk using ones made of metal and carbon fibre. Some people use chips inside their bodies to get into their offices, or to pay for their coffees on their way into work. This world is full of incredible people who are using technology to do amazing things. But the most amazing part of all is that this world is the one we already live in.

Technology has changed all of our lives, and not just with the smartphones or tablets that we use. For many people, particularly those with disabilities, recent technological advances have created the means of the greatly imaginable, and reached a place of possibility. The idea of a bionic limb, for example, is not a new one, and it's right in front of our noses. Far from a scene from a science fiction film, the future is far away from us. This book explores the world of bionics and the future of technology, from bionic limbs (see pages 32-33) to neural implants (pages 40-41), and includes some of the most remarkable that get us there. We will also look at the future of the amazing machines that we already use, as well as what they mean for us as a species. Our journey to the future has already begun, and it's time to get to know Human 2.0.

THE FIRST PROSTHESES

For as long as humans have been around, we have been losing limbs, or even without them. Whether due to an injury or congenital impairment (a condition that is present from birth), people have been trying to replace missing arms, legs, fingers and toes for thousands of years. Early prostheses were made of wood, but over time, as their inventors did not have the technology needed to provide better functionality and comfort. For us, some of these early prostheses closely resemble those that exist today.

The earliest known example of a prosthesis (an artificial body part) belonged to an Egyptian mummyman over 2,000 years ago. This wooden prosthesis replaced the leg on his right foot, and even had a ridge in the shape of a nail carved into it to make it appear more realistic. It would have been strapped onto his foot with string, and sometimes because it would have greatly altered his balance.

The earliest written mention of a prosthesis dates to around 17 BC, and describes the iron hand belonging to the Roman general, Marcus Regius. Regius was said to be one of the first general of his time, especially because of his bravery in battle. Across his campaign he was awarded 23 times, resulting in the loss of his right hand. Regius's replacement hand was designed by his arm, perhaps allowing him to hold a sword for future battles.

Count Götz von Berlichingen Perhaps the most famous example of an early prosthesis is that belonging to the German knight, Count Götz von Berlichingen, who lost his hand during battle in the early 1500s. Count Götz asked his local craftsmen to make an iron hand with digits, fingers and thumb that could lock into place, so he could hold a horse's reins or a weapon. This hand was the first to be made of metal, and some people believe it inspired the phrase, 'to ride with an iron fist'.

WHAT IS BIONIC?

Bionics refers to the transfer of technology between artificial objects and living organisms. The word 'bionics' comes from a combination of the Greek words for 'bio' (life) and 'nautics' (navigation). It was coined by American engineer and writer Jack E. Parnes in the 1960s.

When the word 'bionics' was first used, it was often used to describe the concept of 'biomimicry' - the transfer of ideas from biology to technology. In 1960, Bionics presented an ambitious lecture and reported a gathering of experts on the topic of how new technologies could be discovered by looking at natural systems. This kind of research is known as biomimicry. A few of the key examples to come from the field include: the design of a new kind of aircraft inspired by the structure of a bird's wing, the design of a new kind of robot inspired by the structure of a human brain, and the design of a new kind of robot inspired by the structure of a human brain.

Bionics is often used to describe the transfer of ideas from biology to technology, and the transfer of ideas from technology to biology. Bionics is often used to describe the transfer of ideas from biology to technology, and the transfer of ideas from technology to biology. Bionics is often used to describe the transfer of ideas from biology to technology, and the transfer of ideas from technology to biology.

BIONIC LIMBS AND IMPLANTABLE DEVICES

A prosthesis can be internal or external to the body. The ways in which people can replace parts of their body can largely be broken down into two groups: bionic limbs and implantable devices.

'Implantable devices' is a broad term describing anything that is surgically implanted inside the body. Because surgery is required to gain access, these devices cannot easily be removed, and are typically designed to stay inside the body forever. Examples of these include pacemakers and cochlear implants.

Bionic limbs are artificial body parts, which are intended to replace the function of a human body part, such as an arm or a leg. These are attached to the body, usually via a belt, strap or socket, and can be easily taken on and off by their wearer.

If either a bionic limb or an implant has batteries that need to be charged, they are called 'active'. Those that do not are called 'passive'. Some implants, such as cochlear implants, need batteries. These sit outside the body and attach to the implant via a wire, so the user does not need surgery every time the battery runs out (see pages 28-29).
