A stunningly illustrated tribute for train lovers of all ages, celebrating the ingenuity of trains past, present and future.

- Sample contents: The First Railways; Steam Locomotions; The Ffestiniog Railway; The Orient Express; Freight Trains; The Baikonur Cosmodrome; Mail by Rail; The California Zephyr; Mountain Railways; The Darjeeling Himalayan Railway; Trams; Sky Lines; Railways At War; The Princess Christian; High-speed Rail; The Shinkansen
- Beautiful artwork by multi award-winning artist Ryo Takemasa
- Stunning journey through the history of locomotives, suitable for all ages
- Expertly written by railway historian, Alastair Steele

Locomotion

THE FIRST RAILWAYS

It is strange to think that they have only been around as we know them for about two hundred years.

fluffing this were on a different many other engines. The first public railway to use steam locomotives, the Stockton and Darlington Railway in England, opened in 1825. It was designed by George Stephenson, who went on to be known as the "Father of Railways" for his influential role in so many early railways.

THE GAUGE

One of Stephenson's most significant decisions was to set the gauge for British railways. The gauge is the distance between the rails and is measured from the inside edge of one rail to the other. By using the same gauge in different railways, Stephenson could ensure that the train runs smoothly when they connected. He decided to set a gauge of 4.35ft (1.33m), which became known as the standard gauge. Today, more than half of the world's railways use this gauge.

The standard gauge was not without its rivals. In north-east England, Britain, engineers of the British Great Western Railway, insisted on a broad gauge wider than the standard gauge. In 1825, the first railway, set at a width of 2.5 metres, allowed for more stability at speed, and bigger vehicles which could carry greater loads. Unfortunately for Britain, this train arrived too late to compete, and by 1862 of the two gauges had been converted to the narrower gauge of the rival Stephenson.

STEAM LOCOMOTIVES

Once the possibility of steam-powered engines had been realized, a whole host of locomotives were tried and tested around the world. Some proved too heavy, others too unreliable and some were so dangerous, but the arrival of one revolutionary design changed the course of history. Rocket, designed by engineer Robert Stephenson (George Stephenson's son - see page 8) was to provide the principal design for the vast majority of steam locomotives that follow.

of steam locomotives that followed.

Heat from the fire passes through the **boiler** via smaller tubes. The heat the water to boiling point, raising the steam pressure.

As the pressure builds, the steam is directed to the **exhausters**. These are controlled by valves, which act like a **gasoline** in a car. The steam pressure does not **explode** outside the exhausters, sending the wheels on a rail which connects them.

A major part of Richter's revolutionary design was the helix. Multiple tubes ran through a frame that they, almost unaided, flattened into a spiral and passed the water more easily. A thin pipe was used to send steam from the cylinders into the chimney, helping to pull the hot gases along the tubes. This meant a more even flow and increased efficiency. Richter's early tubes and their pipes, like Richter himself, ran straight from the point of origin.

ELECTRIC LOCOMOTIVES

The first electric train was tested as far back as 1837. Unlike steam trains, electric locomotives do not carry fuel on-board. Instead, they are powered by electricity which can be supplied from overhead lines, a third rail or in storage such as batteries. Because electric trains can be powered by renewable energy sources, they are considered less polluting than steam or diesel trains.

The first electric passenger train was presented by Werner von Siemens at an exhibition in Berlin in 1879. Consisting of a small locomotive and three cars, it reached a speed of just 13km/h.

The *ETR 200* is a record-breaking electric passenger train. It is widely considered one of the first ever high-speed trains and was put into service in 1936. In 1939, it broke the speed record for trains by reaching just over 201km/h.

The ICE (InterCity Express) is one of Germany's most successful electric trains. The third generation ICE 3, can reach speeds of 300km/h. Since 2018, it has run on entirely **renewable energy** sources.

DIESEL LOCOMOTIVES

In a diesel locomotive, the power comes from an engine that burns diesel oil. While a steam locomotive needed two people to crew it and hours to attain the right steam pressure, a diesel locomotive could simply be switched on and driven away, making them much easier and much cheaper to run. Rudolf Diesel patented his first diesel engine in 1898, but it wasn't until around 1912 that they were first used in a locomotive.

The famous DRG Class SVT 877 *Hamburg Flyer*, often referred to as the 'Flying Hamburger', was first put into service in 1933. Its smooth, rounded shape was influenced by Zeppelin **airships** allowing for minimal air resistance.

The *Delic*, built in 1956, was considered the most powerful diesel locomotive in the world at that time.

The *Intercity 125* is one of the most successful diesel trains of all time. So named because it was designed to cruise at 125 mph (about 201 km/h) when in service, it also holds the all-time speed record for diesel trains of 238 km/h, which it reached in 1987.

- RAILWAYS OF THE WORLD -
THE FFESTINIOG RAILWAY

The Fløistings railway in North Wales is a marvel of 19th century engineering. It was built to transport slate for roof tiles from the quarries around the town of Ffestiofion, high up in the mountains of Snowdonia, down to the harbour at Porthmadog. It opened in 1836 using a narrow gauge of 5'7" to match the wagons already in use in the quarries.

By the 1950s, the railway was generating so much work coping with the fact the horses couldn't keep up. There was also increasing demand for a passenger service, which meant the railway had to be reworked. The solution was for several small steam engines to be built, which were among the first narrow gauge locomotives in the world. By 1960, there were six working, the first, but more were then begun to cater for the demand.

1. *Early*, a revolutionary idea presented to the railway in 1825, was, says *Engineer Robert Farnie*, who had patented the Double Farnie, an ingenious double-ended locomotive design. This was in effect two locomotives connected back to back and running on a pair of *Engines*, which saved the expense of having two men but doubled the power output. The first of these was collected as *Director*, and over the next 17 years another three Double Farnies were built for the railway. They were so successful that Robert Farnie allowed the railway to use his *patent* for this device, something it couldn't do at the time.
